**16-CHANNEL CONSTANT CURRENT LED DRIVER**  
**WITH PROGRAMMABLE PWM OUTPUTS**

## DM632C

### 16-CHANNEL CONSTANT CURRENT LED DRIVER WITH PROGRAMMABLE PWM OUTPUTS

#### General Description

DM632C is a 16-channel constant current sink LED driver. Each channel has adjustable 16-bits (65536 steps) grayscale PWM control current outputs. It incorporates shift registers, data latches, constant current circuitry with current value set by an external resistor, selectable oscillator source for PWM functioning, and built-in LED open detection circuit to detect error status. It is specifically designed for LED display or lighting applications.

#### Features

- Constant-current outputs: 5mA to 90mA adjustable by one external resistor
- 16-bit linear PWM control current outputs for each channel
- Maximum output voltage: 17V
- Maximum clock frequency: 25MHz
- Selectable internal/external PWM reference clock
- PWM free-running capability (refresh rate (~ 275Hz) with internal oscillator (~ 18 MHz))
- Build-in real-time open detection
- Package and pin assignment (except QFN32) compatible to pure LED driver series (ST2221C, DM134/5/6, DM13C)
- Power supply voltage: 3.3V to 5.5V

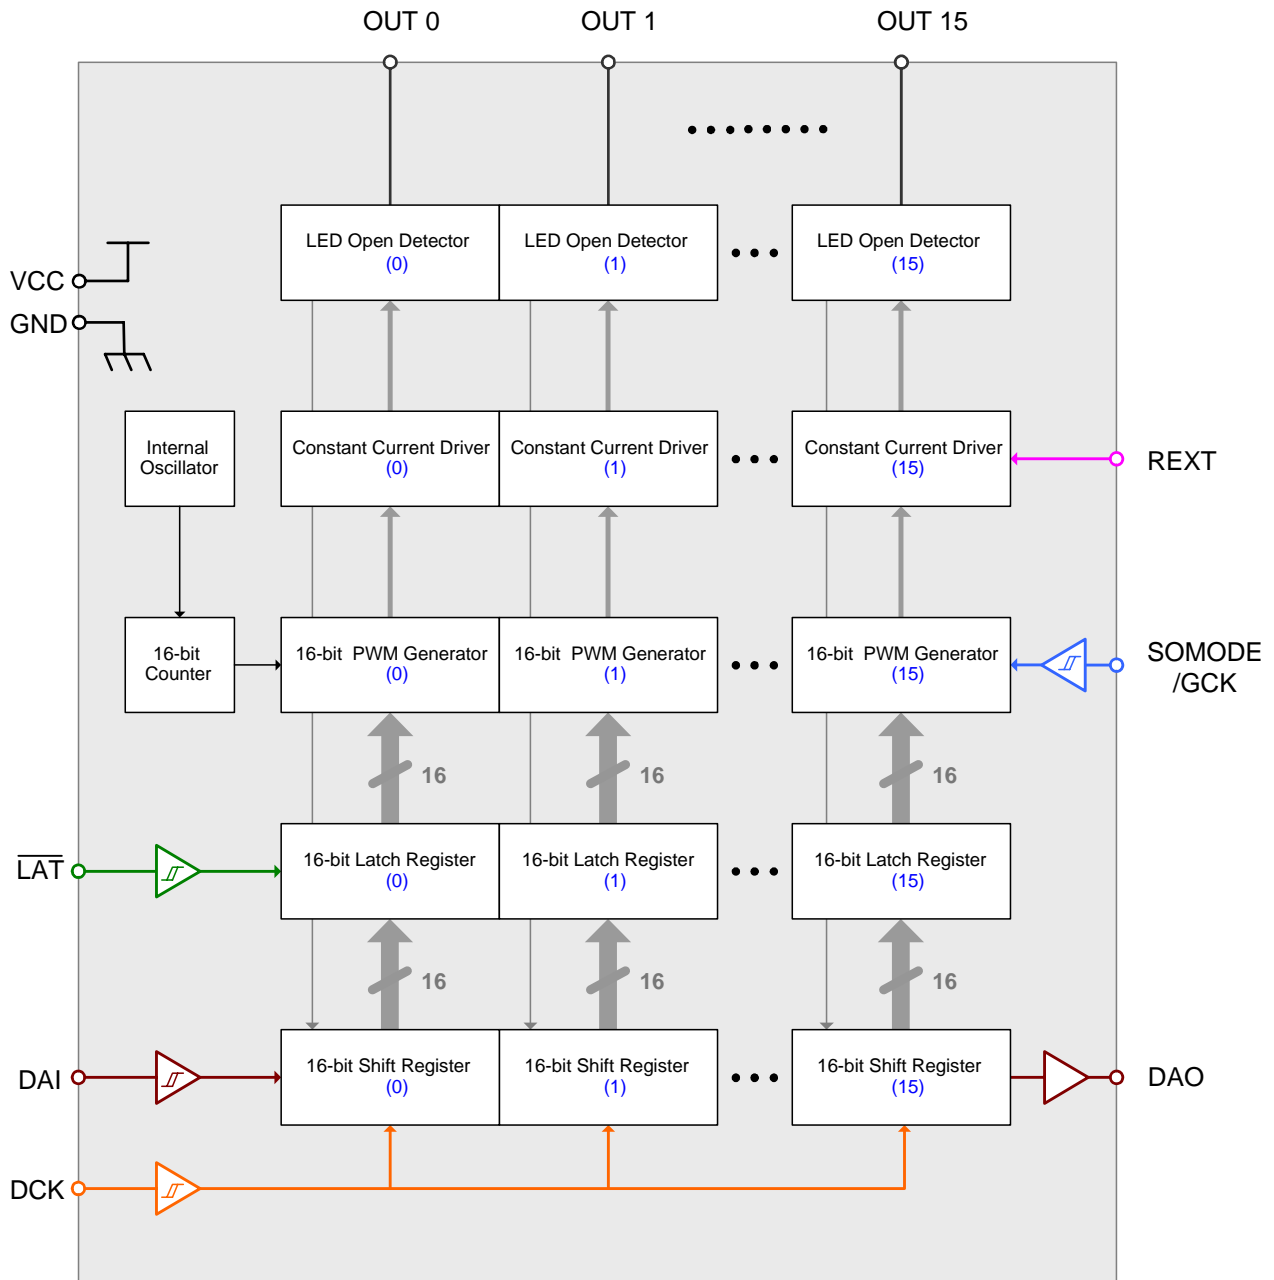

#### Applications

- Indoor/Outdoor LED Video Display
- LED Variable Message Signs (VMS) System
- LED Decorative Lighting

#### Package Types

- SOP24, SOP24B, SSOP24, TSSOP24E (with exposed pad), QFN32 (with exposed pad)

● **Block Diagram**

## Pin Connection

## Pin Description

PIN No.	PIN NAME	FUNCTION
SOP24/SOP24B/SSOP24/TSSOP24E: 1 TSSOP24E, QFN32: exposed pad QFN32: 1, 2, 5, 6, 7, 8, 20,21	GND	Ground terminal.
SOP24/SOP24B/SSOP24/TSSOP24E: 2 QFN32: 9	DAI	Serial data input terminal.
SOP24/SOP24B/SSOP24/TSSOP24E: 3 QFN32: 10	DCK	Synchronous clock input terminal for serial data transfer. Data is sampled at the rising edge of DCK.
SOP24/SOP24B/SSOP24/TSSOP24E: 4 QFN32: 11	$\overline{\text{LAT}}$	Input terminal of data strobe: ‘H’ means data on shift register goes through latch (level trigger), ‘L’ means data is latched.
SOP24/SOP24B/SSOP24/TSSOP24E: 5~20 QFN32: 12~19, 22~29	OUT0~15	Sink constant-current outputs (open-drain).
SOP24/SOP24B/SSOP24/TSSOP24E: 21 QFN32: 30	SOMODE /GCK	Serial Out Mode Selection(SOMODE) : ‘H’: DAO is shifted out and synchronized to falling edge of DCK, ‘L’ : DAO is shifted out and synchronized to rising edge of DCK. Gray Scale Clock(GCK) : Input terminal for PWM operation.
SOP24/SOP24B/SSOP24/TSSOP24E: 22 QFN32: 31	DAO	Serial data output terminal.
SOP24/SOP24B/SSOP24/TSSOP24E: 23 QFN32: 32	REXT	External resistors connected between REXT and GND for output current value setting.
SOP24/SOP24B/SSOP24/TSSOP24E: 24 QFN32: 3, 4	VCC	Supply voltage terminal.

## Equivalent Circuit of Inputs and Outputs

### 1. DCK, DAI, $\overline{\text{LAT}}$ , SOMODE/GCK terminals

### 2. DAO terminals

## PCB Layout Consideration

To connect an external resistor to REXT pin and ground can determine the maximum output current. If there is any disturbance occurred to REXT pin, the constant current output may be unstable or noisy. Since REXT (pin23), DAO (pin22), and SOMODE/GCK (pin21) are next to each other, the most possible interference is caused by DAO or SOMODE/GCK signal. Accordingly, it is recommended that adding some shielding area within the above pins in PCB layout, or laying the signal line of above pins on different PCB layer will prevent the noise problems effectively.

## Maximum Ratings (Ta=25°C, Tj(max) = 150°C)

CHARACTERISTIC	SYMBOL	RATING	UNIT
Supply Voltage	VCC	-0.3 ~ 7.0	V
Input Voltage	VIN	-0.3 ~ VCC+0.3	V
Output Current	IOUT	100	mA
Output Voltage	VOUT	-0.3 ~ 17	V
Input Clock Frequency	FDCK	25	MHz
GND Terminal Current	IGND	1600	mA
Power Dissipation (4 layer PCB, at Ta=25°C)	PD	4.46 ( QFN32 )	W
		4.17 ( TSSOP24E exposed pad )	
		2.45 ( SOP24 )	
		2.19 ( SOP24B )	
		1.79 ( SSOP24 )	
Thermal Resistance (4 layer PCB, at Ta=25°C)	Rth(j-a)	28 ( QFN32 )	°C/W
		30 ( TSSOP24E exposed pad )	
		51 ( SOP24 )	
		57 ( SOP24B )	
		70 ( SSOP24 )	
Operating Temperature	Top	-40 ~ 85	°C
Storage Temperature	Tstg	-55 ~ 150	°C

## Recommended Operating Condition

CHARACTERISTIC	SYMBOL	CONDITION	MIN.	TYP.	MAX.	UNIT
Supply Voltage	VCC	—	3.3	5.0	5.5	V
Output Voltage	VOUT	Driver On <sup>*1</sup>	1.0	—	0.5VCC	V
Output Voltage	VOUT	Driver Off <sup>*2</sup>	—	—	17	
Output Current	IO	OUTn	5	—	90	mA
	IOH	VOH = VCC – 0.4 V	-0.8	—	-2	
	IOL	VOL = 0.2 V	+0.8	—	+2	
Input Voltage	VIH	VCC = 3.3 V ~ 5.5V	0.8VCC	—	VCC	V
	VIL		0.0	—	0.2VCC	
Input Clock Frequency	FDCK	Single Chip Operation	—	—	25	MHz
Input PWM Frequency	FGCK	3.3V~5.5V	—	—	25	
LAT Pulse Width	Tw LAT	VCC = 5.0V	15	—	—	ns
DCK Pulse Width	Tw DCK		15	—	—	
Set-up Time for DAI	tsetup(D)		10	—	—	
Hold Time for DAI	thold(D)		10	—	—

Switching Characteristics Test Circuit

\*1 Reload the new PWM data at the end of the last PWM frame.

### Constant-Current Output

Constant-current value ( $I_{out}^{*1}$ ) of each output channel is set by an external resistor connected between the REXT pin and GND. The current scale ranging can be adjusted from 5mA to 90mA by varying the resistor value. The reference voltage of REXT terminal ( $V_{rext}$ ) is approximately 1.23V. The output current value is calculated by the following equation:

$I_{out}(mA)$	5	10	20	30	40	50	60	70	80	90
<b>M</b>	50.86	48.60	48.39	47.66	46.97	46.13	44.74	43.94	43.20	42.24

Output Current as a Function of Rext value

Output Current as a Function of Output Voltage

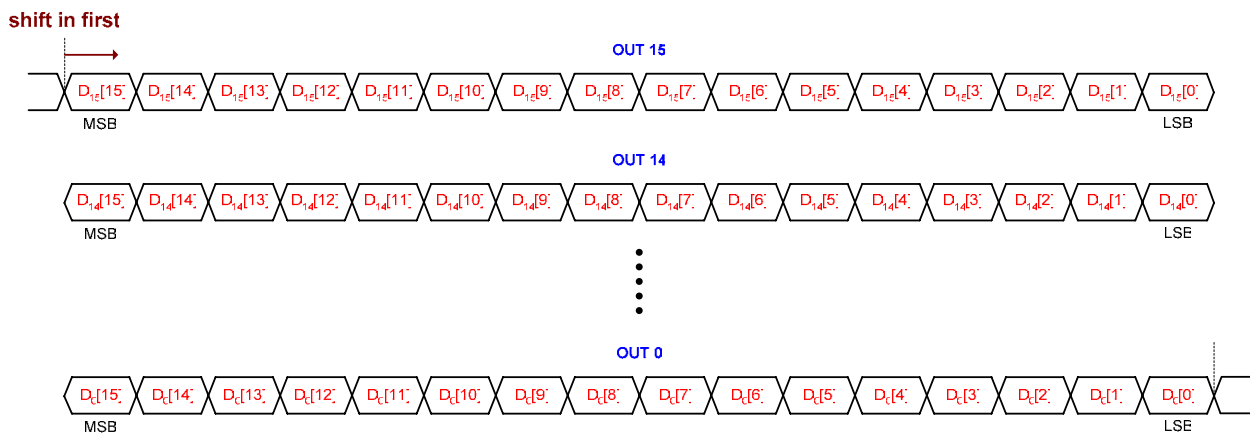

In order to obtain a good performance of constant-current output, a suitable output voltage is necessary. Users can get related information about the minimum output voltage above.

\*1  $I_{out}$  is typical current value setting under 100% PWM duty cycle.

## Serial Data Interface

The serial-in data (DAI) will be clocked into 16 × 16 bit shift registers synchronized on the rising edge of the clock (DCK). The data will be transferred into the 16 × 16 bit latch registers when the strobe signal ( $\overline{\text{LAT}}$ ) is kept at high level (level trigger); otherwise, the data will be held. The latch pulse should be sent after the falling edge of the last clock within a frame data. When the operation mode is the **free-running** PWM. The trigger timing of the serial-out data (DAO) will be shifted out on synchronization to the rising edge of the clock if serial out selection (SOMODE) is kept at low level. And if serial out selection (SOMODE) is kept at high level, the serial-out data (DAO) will be shifted out on synchronization to the falling edge of the clock (DCK).

## Input Data Format

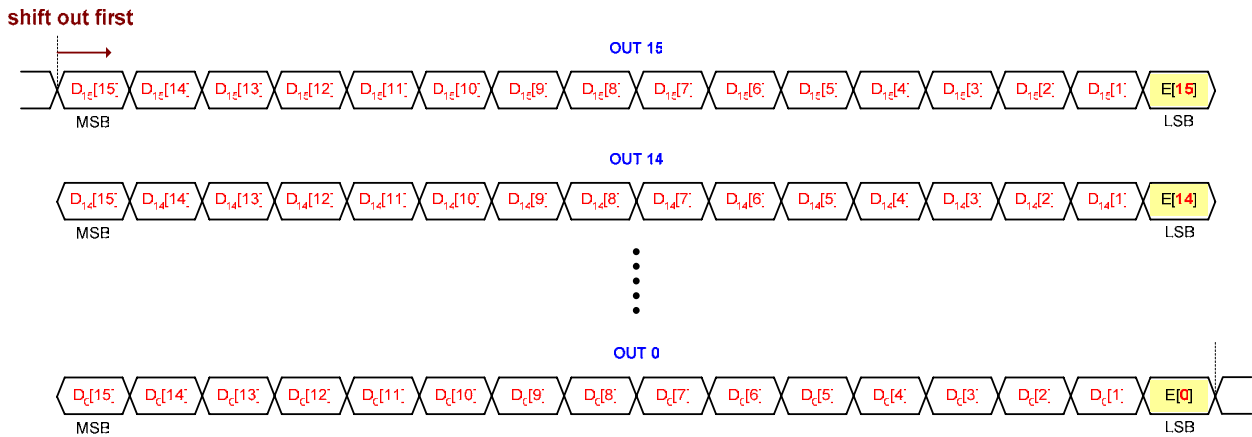

$$\text{Active width per frame(\%)} = \frac{D[15] \times 2^{15} + D[14] \times 2^{14} + D[13] \times 2^{13} + D[12] \times 2^{12} + D[11] \times 2^{11} + D[10] \times 2^{10} + D[9] \times 2^9 + D[8] \times 2^8 + D[7] \times 2^7 + D[6] \times 2^6 + D[5] \times 2^5 + D[4] \times 2^4 + D[3] \times 2^3 + D[2] \times 2^2 + D[1] \times 2^1 + D[0] \times 2^0}{65536}$$

## LED Open Detection

DM632C provides a real time monitor of LED open detection function without extra components or circuit design. It will be identified as a LED open failure when the output is turned on but the output voltage is below 0.3V. The test result of each channel will write to its correspondent shift register which is in LSB position (D<sub>15</sub>[0], D<sub>14</sub>[0], ..., D<sub>0</sub>[0]) while strobe signal is active. User can refer to timing diagram on page13. Detecting report could be retrieved from serial-out (DAO) data. If the system reads '1' back, that indicates LED is in normal status. But if '0' was retrieved then LED open failure has occurred. In order to make sure LED open detection function is in well operating condition, it is recommended that all the luminance data are wrote to '1' then almost turning on the outputs during detection process.

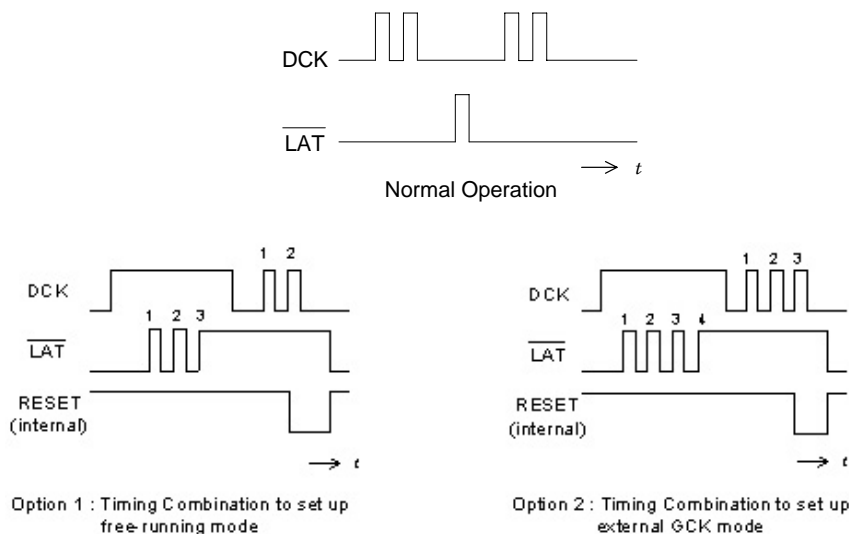

## Serial-out Data Format

\* E[15], E[14], ... , E[0] are Error Message of LED Open Detection. '1' is normal, and '0' is abnormal.

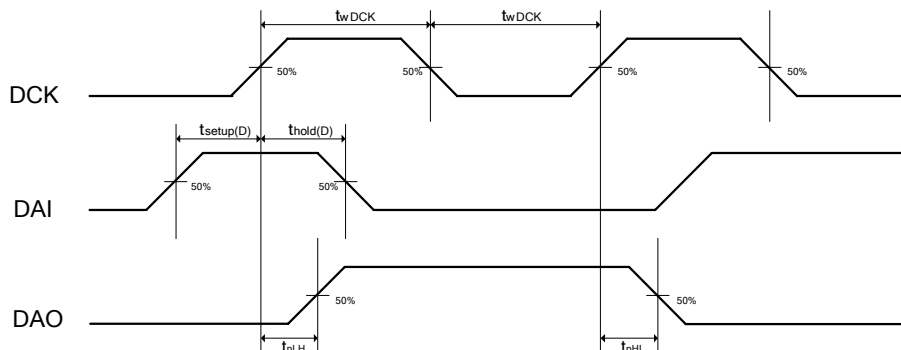

## Selection of External/Internal PWM Frequency

The default operation mode is the **external GCK mode**. The SOMODE/GCK pin could input external frequency to operate PWM function. Users could switch external to internal PWM frequency source by following timing sequence. There are two alternative options could be selected. The option 1 shows three rising edge of latch pulses ( $\overline{\text{LAT}}$ ) when the clock (DCK) kept at high level then two rising edge of clock (DCK) pulses when the latch pulse ( $\overline{\text{LAT}}$ ) kept at high level. Then the external GCK mode can be set up to the **free-running mode** what is the free-running PWM signal generated by internal oscillator. The option 2 shows four rising edge of latch pulses ( $\overline{\text{LAT}}$ ) when clock(DCK) kept at high level then sending three rising edge of clock (DCK) signal, while latch( $\overline{\text{LAT}}$ ) signal kept high level at the same time. Meanwhile the free-running mode can be set back to the GCK external mode. Notice that when internal RESET at low level, all the shift registers in DM632C will be cleared (Kept at Low level) and all output current will be off immediately.

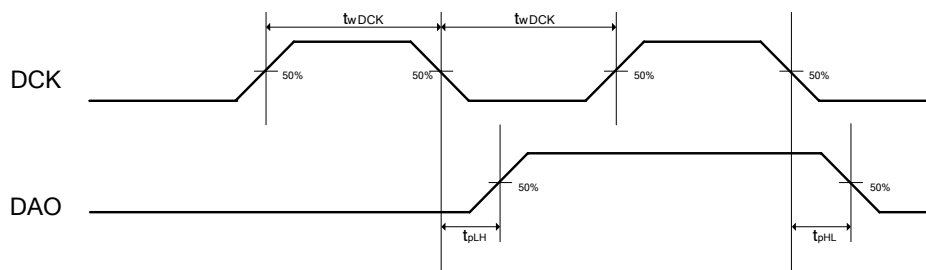

## Timing Diagram

### 1. DCK-DAI, DAO (SOMODE = "L" at free-running mode, or external GCK mode)

### 2. DCK, DAO (SOMODE = "H" at free-running mode)

### 3. DCK-LAT

### 4. Output to Output Delay Time Unit (n=2,3,4,5,6,7, 10, 11, 12, 13, 14, 15)

### 5. GCK-OUT<sub>0</sub>

**Timing Diagram** (external GCK mode switch to free-running mode)

<sup>1</sup> DAO is shifted out on synchronization to rising / falling edge of DCK according to SOMODE is 'L' / 'H' .

<sup>2</sup> E[0] is the error message of LED open detection.

<sup>3</sup> LAT is level trigger, not edge trigger.

<sup>4</sup> SOMODE function work in external GCK mode.

<sup>5</sup> While switching to free-running mode, all registers in DM632 will be reset simultaneously.

<sup>6</sup> Starting the new PWM frame after the last PWM period finish completely.

<sup>7</sup> While switching to free-running mode, outputs will be active after 65536 GCK pulse.

<sup>8</sup> When using external frequency for PWM operation, the PWM refresh rate (frame rate) can be calculated by following equation:

$$\text{Refresh Rate (Hz)} = \frac{\text{Input GCK Frequency (Hz)}}{\text{Total PWM resolution ( } 2^{16} \text{ )}}$$

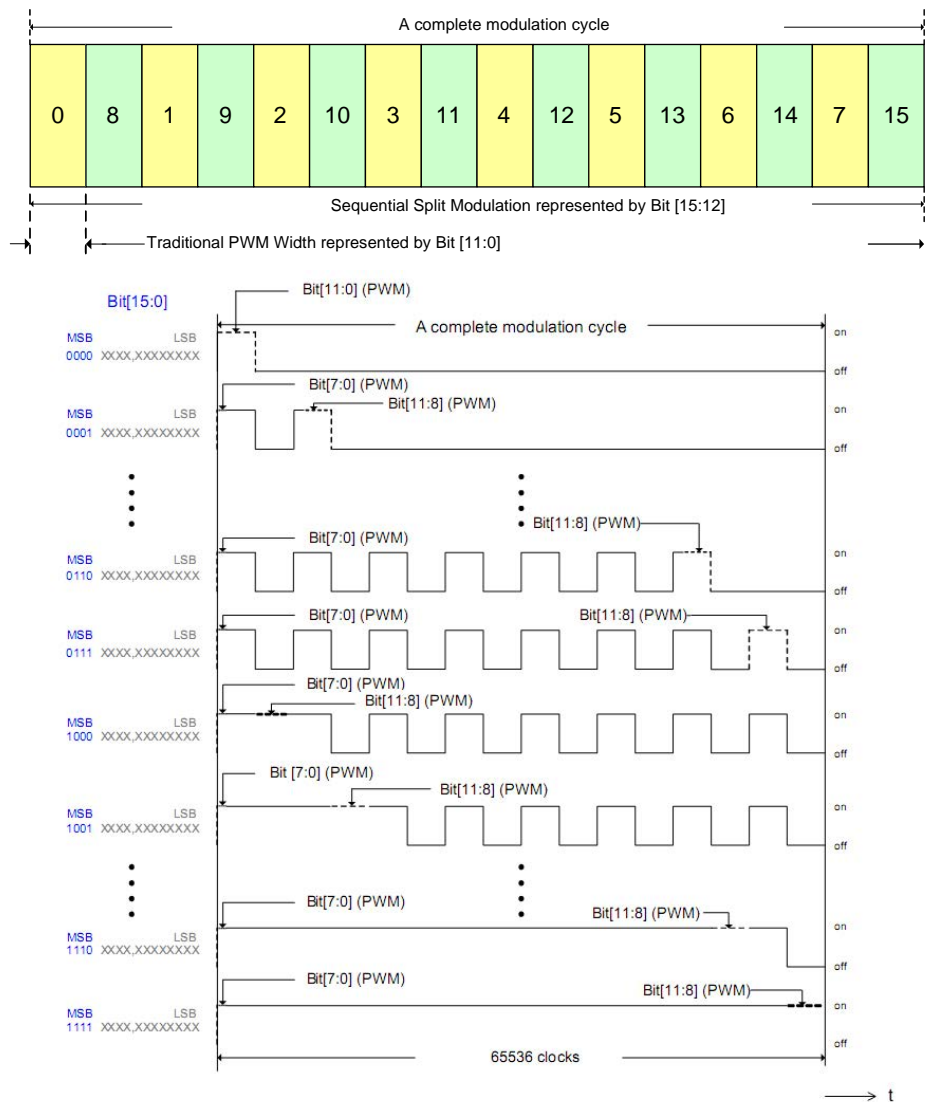

For example, if the refresh rate in display system is higher than 60Hz, the input GCK frequency must be higher than 4MHz.

**Timing Diagram (free-running mode switch to external GCK mode)**

## Output Modulation Technique

DM632C provides a new LED drive technique of output modulation. It mixes traditional Pulse Width Modulation (PWM) represented by LSB 12 bit with Sequential Split Modulation (SSM) represented by MSB 4 bit. The main benefits of SSM are to drive LED with an equivalent higher refresh rate (up to 380Hz in DM632 when  $F_{GCK} = 25\text{MHz}$ ) and change bit to next bit smoothly. The relationships between PWM and SSM in time domain can be refer to the diagram (not to scale) below:

## Ultra High Resolution Current Outputs

DM632C could provide 16-bit linear PWM control current outputs for each channel. There are two advantages for system design. One is DM632C has sufficient bit resolution (65536 steps), not only LED color information but additional data such as global brightness, dot correction, and gamma correction can be represented by the proper algorithms. The other is to reduce a lot of clock and data rate compared to conventional ON-OFF type LED drivers.

## Global Brightness Control

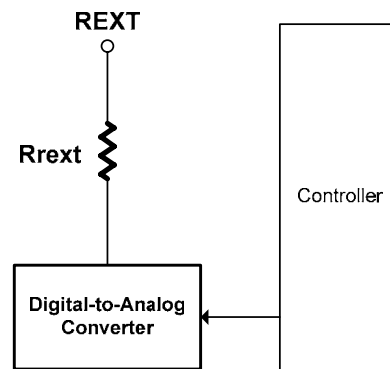

DM632C has no built-in global brightness control feature. In order to obtain a lower resolution of global brightness control effect, two methods could be utilized. Here show different ways to adjust the R<sub>REXT</sub> value or voltage drop across the external resistor. Please see the reference circuit below:

Global Brightness Control with Resistor Ladder

Global Brightness Control with Digital Resistor

Global Brightness Control with D/A converter

## Output to Output Delay

DM632C has build-in output to output delay with a special arrangement. This arrangement help chip avoid noise cause by large current during channels switching. The arrangement details are shown as following table.

Channel	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Delay units	0	4	1	5	2	6	3	7	3	7	2	6	1	5	0	4

## Power Dissipation

The power dissipation of a semiconductor chip is limited to its package and ambient temperature, in which the device requires the maximum output current calculated for given operating conditions. The maximum allowable power consumption can be calculated by the following equation:

$$Pd(max)(Watt) = \frac{Tj(junction\ temperature)(max)(\text{ }^{\circ}C) - Ta(ambient\ temperature)(\text{ }^{\circ}C)}{Rth(junction\text{-to}\text{-air\ thermal\ resistance})(\text{ }^{\circ}C/Watt)}$$

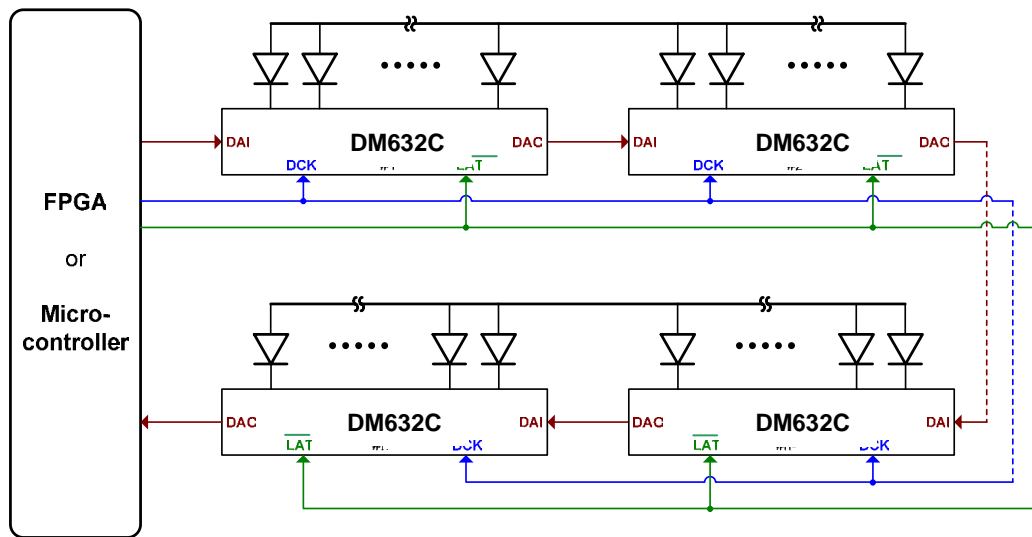

The relationship between power dissipation and operating temperature can be refer to the figure below:

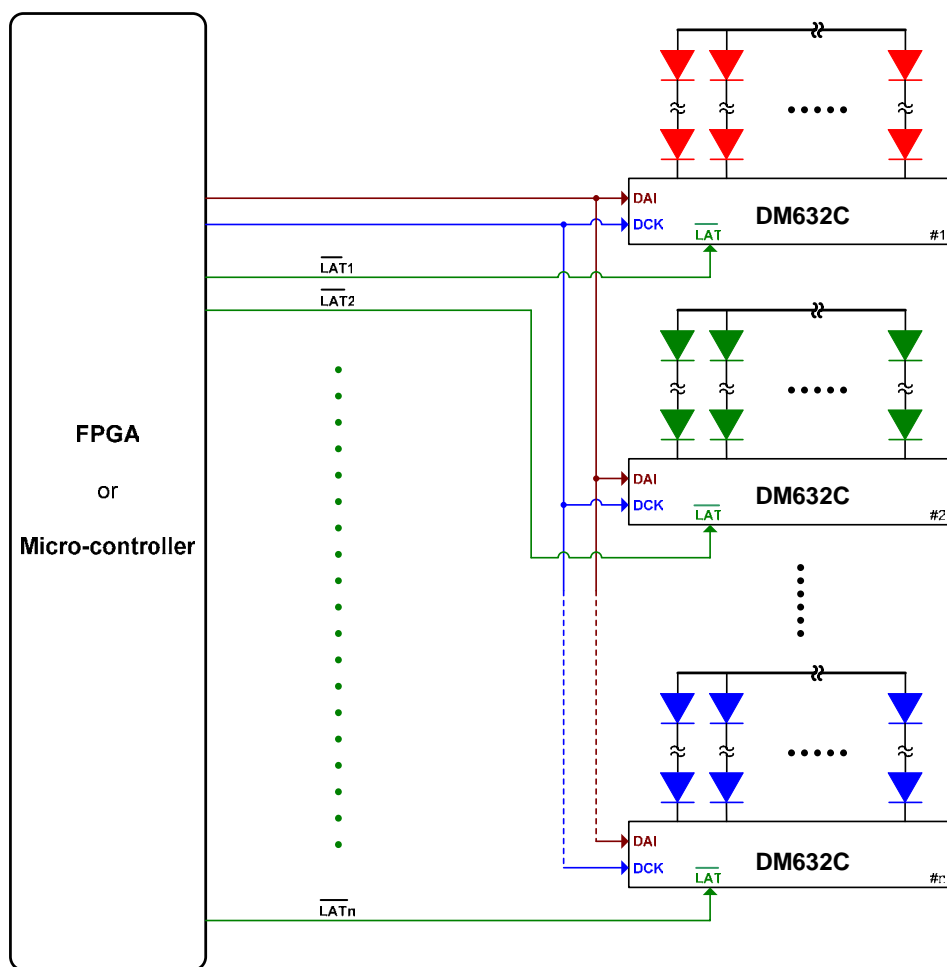

The power consumption of IC can be determined by the following equation and should be less than the maximum allowable power dissipation:

$$Pd(W) = Vcc(V) \times I_{DD}(A) + V_{out0} \times I_{out0} \times Duty_0 + \dots + V_{out15} \times I_{out15} \times Duty_{15} \leq Pd(max)(W)$$
